

TEC-1G

Power Delivery

Expansion Connectors

General Purpose Input/Output

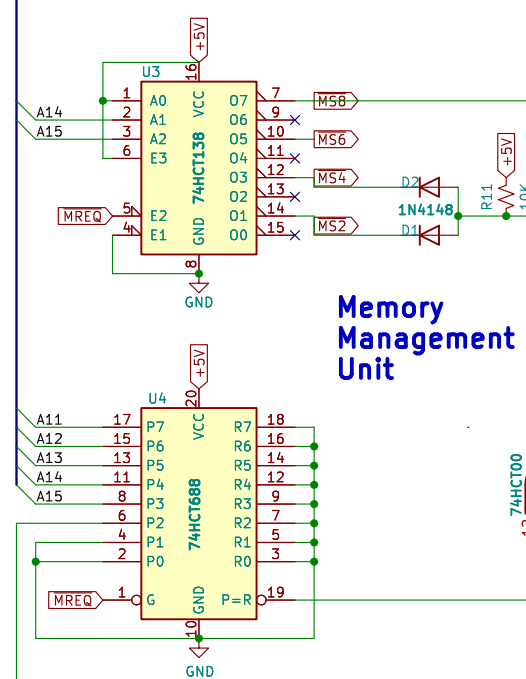

The TEC Deck

The new way to expand your TEC-1!
With appropriate long-legged headers, expansion boards can be stacked on top of each other, just like the original TEC-1 but now you have access to ALL the Z80 pins as well as port and memory select lines. No more ugly fly leads or cables. Memory Expansion of 512K with ease. Input/Output options for days!

The ROM is selected (asserted LOW) if
Any address in the lower 2K is requested (with Shadow ON)
OR
If an address is within the top 16K of 64K.
OTHERWISE
The RAM is selected if the address falls within the lower half (32K) of the memory map.

To remove the Shadowed ROM, an Output of ONE to Bit 0 of Port \$FF removes the ROM from lower 2K.
(It is possible to Shadow it back in with an Output of 0 to Bit 0 of Port \$FF)

Memory Protection

On Reset, all RAM is writeable. Under software control sending Bit 2 High of Port \$FF turns ON write protect of the RAM in the second 16K memory space.
Sending to Port \$FF a value with Bit 2 clear will remove write protection.

System Latch

This critical latch controls a lot of important functions, and will also be the centre of huge memory expansions to come.

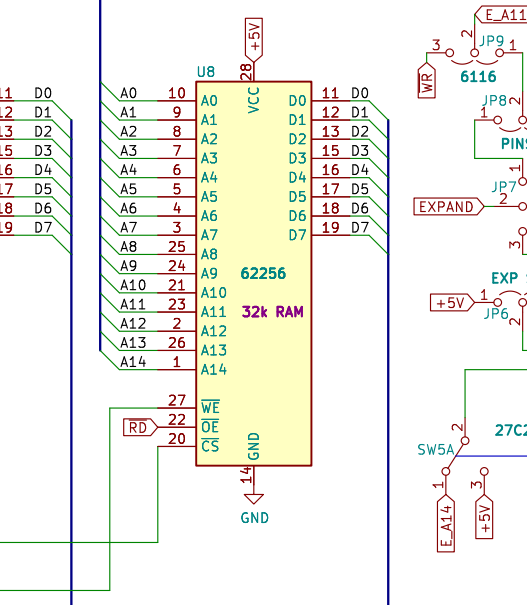

LCD 20 Characters x 4 Lines

(C8 is optional and only required if your LCD display gets corrupted)

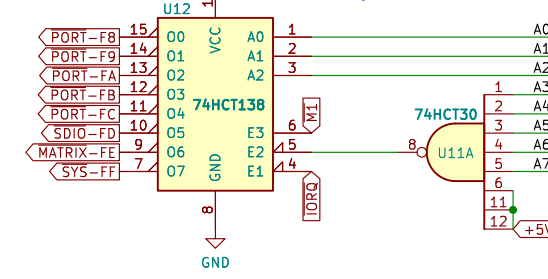

64k Memory

The lower 32K is all RAM in a single chip. The upper 16K of the memory map is reserved for the system ROM, although it is made up of up to a 64K EPROM to allow selection of multiple monitors, using a pair of switches.

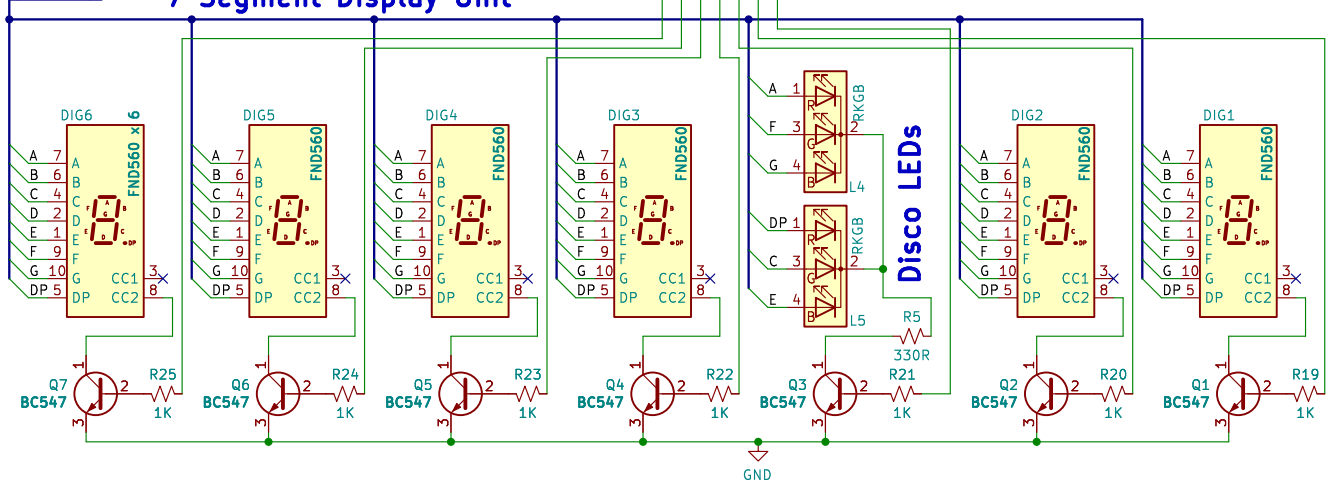

I/O Decoders

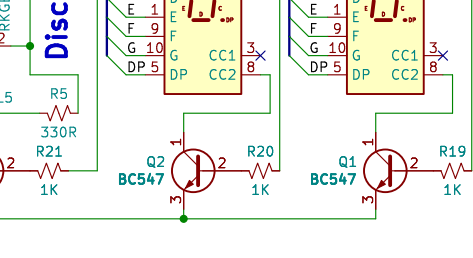

System Input

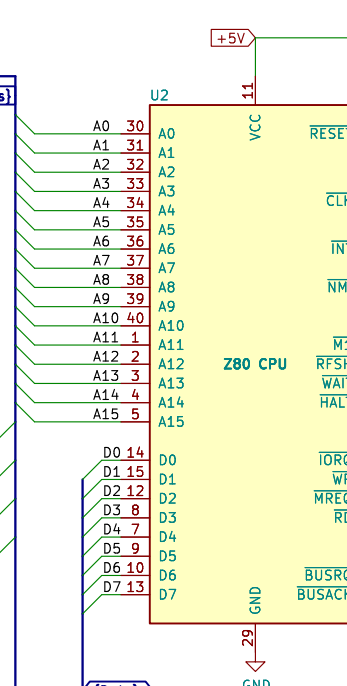

7 Segment Display Unit

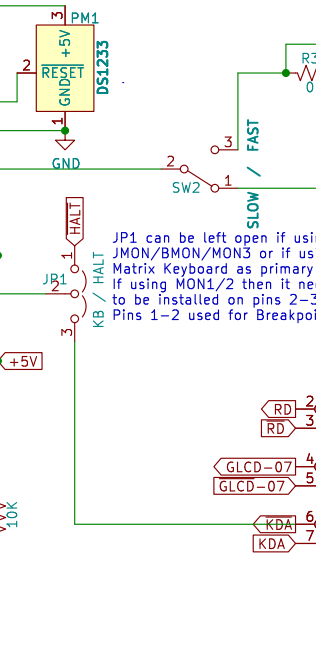

Disco LEDs

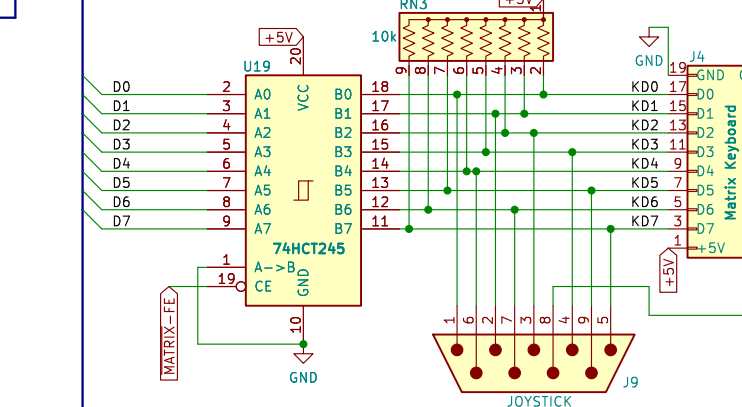

CPU & Clock

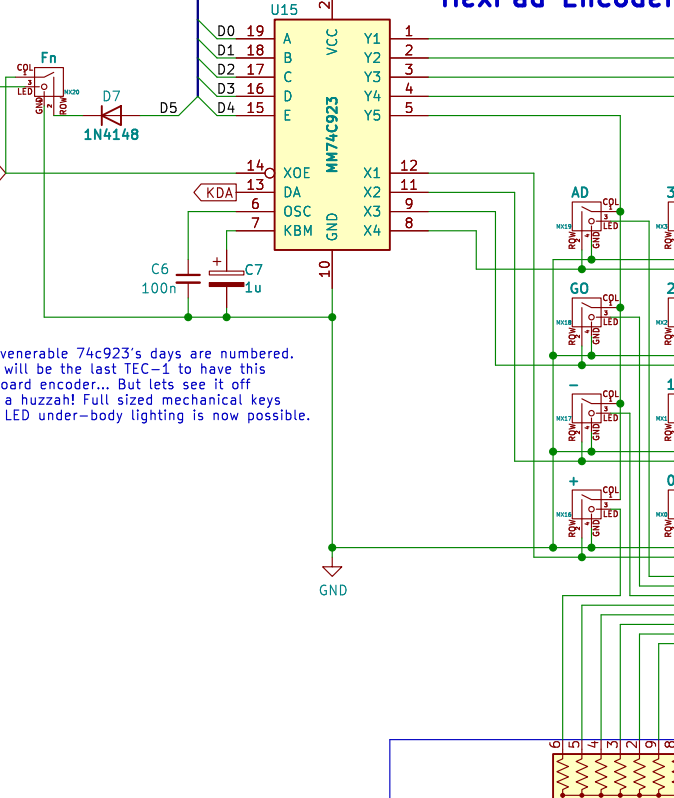

The DS1233 is a Power/Reset manager that is optional. If it is NOT installed then Capacitor C5 needs to be a 100uF electrolytic, mindng polarity. Otherwise, a ceramic 10nF is required.

Matrix Keyboard & Joystick

HexPad Encoder

Modelled on the TEC-1 rev.D with DAT add-on
